

# FRACTURED FEMUR

## MAKING AN IMPROVISED TRACTION SPLINT

### Traction Detail

Foot is wrapped (see detail below) and attached to stick with a hitch that places the entire system under light tension

### S-Hitch Detail

This hitch is a useful alternative to the sprained ankle hitch

### Foot-Wrap Detail

The sprained ankle hitch is the standard tie-off method, creating a strong and stable point from which to pull traction—see the S-Hitch alternative to the right

It is important to maintain manual traction throughout the process
